

Advanced Data Visualizations with **Stata**: Part III

Asjad Naqvi

Austrian Institute of Economic Research (WIFO)
Vienna University of Economics and Business (WU)
International Institute for Applied Systems Analysis (IIASA)

Stata UK Conference
8 September 2022

Background

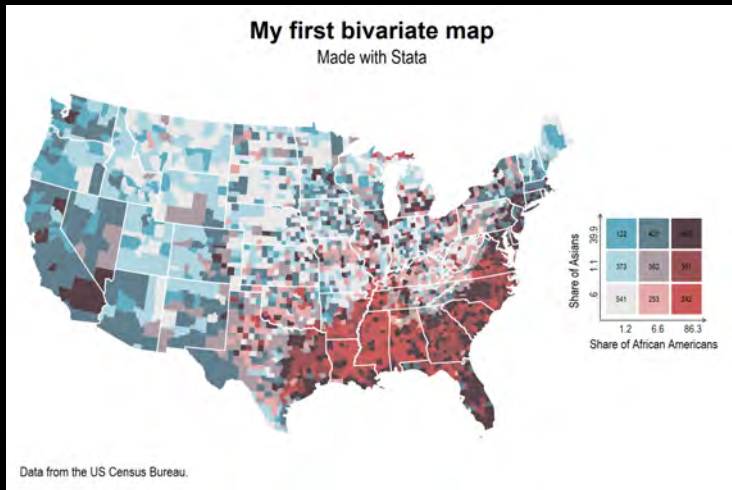

- Based in Vienna, Austria
- Some 20 years of research
- Numerous projects using Stata since 2003
 - Data management, workflow, analysis
- Why do all the dataviz stuff?
 - Explosion of COVID-19 related dataviz + work-from-home + curiosity
 - Huge positive response from the online community

Why we need more #StataViz?

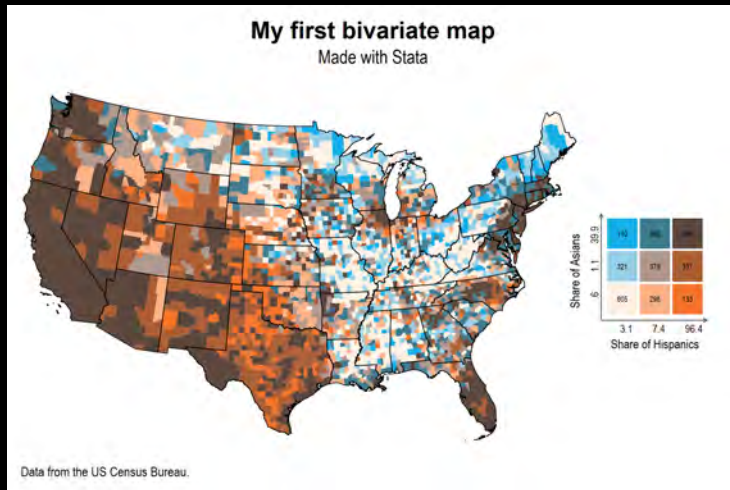

- A lot of potential given the existing Stata/Mata structure
- Lots of exciting developments in terms of dataviz packages:
 - `palettes` (Jann), `spmap` (Pisati)
 - My own packages: `bimap`, `joyplot`, `streamplot`, `clipgeo`, `delaunay`, `marimekko`, `arcplot`, `schemepack`
 - Plus many more #StataViz packages by others are now out!
- What I will discuss today:
 - Maps
 - Polar plots
 - Plotting hierarchical data

- The ability to make maps in Stata has improved considerably, thanks to the `spmap` (Pisati) and the `palettes` (Jann) packages.
- A lot of additional work has been done in the past two years to further enhance mapping capabilities in Stata
- Some of this work is showcased below

Bi-variate maps (ssc install **bimap**, replace)

Bi-variate maps (ssc install bimap, replace)

clipgeo (ssc install clipgeo, replace) - Line clipping

clipgeo - Box clipping

clipgeo v2 - Circle clipping

clipgeo v2 - Polygon clipping and rotation

clipgeo - Polygons

clipgeo - Polygon box clipping

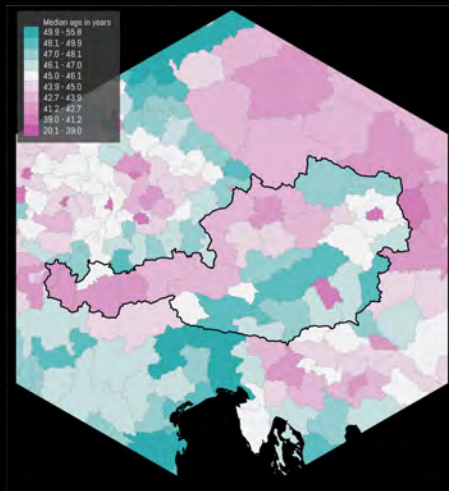

clipgeo - Polygon box clipping + spmap + palettes

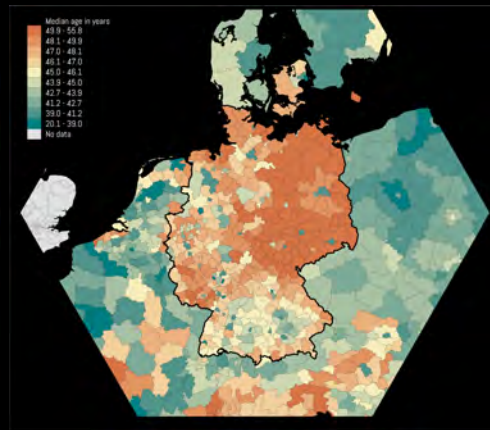

clipgeo v2 - Polygon circle clipping

clipgeo v2 - Polygon clipping variations

clipgeo v2 - Polygon clipping variations

clipgeo v2

The **clipgeo v2** makes several enhancements to the package:

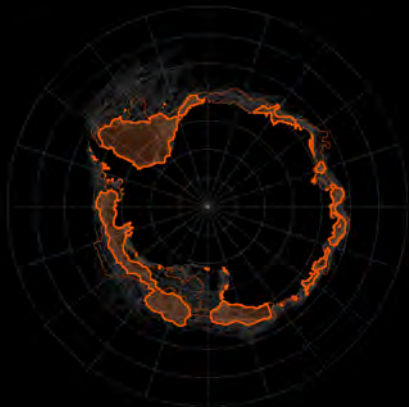

- Much faster plotting
- We can now clip on any regular polygon (polygons with equal sides)
- Circular clipping
- Polygon rotation

Polar plots

Polar plots

Source: *The World in Data*, December 2019. <1 million cases are labeled. @4ajournal

Half sunburst plot

Arc plots (now available as the [arcplot](#) package)

Hierarchical flows: Sankey

Data hierarchies

Hierarchical stocks: `circlepack`

- Plot nested lists as circles within circles.
- Circle packing requires a packing algorithm that maximize the area of a starting circle, such that no circles overlap.
- The circlepack package uses the “circlify” algorithm
- Like squarify, “circlify” is an iterative algorithm, that starts with the largest circle and iteratively adds other circles, until the best fit is achieved.

→ Demo

Hierarchical stocks: [circlepack](#)

Population of EU 27 countries

Population of EU 27 - NUTS0, NUTS1, NUTS2

Hierarchical stocks: [circlepack](#)

Population of Austria at NUTS2 and NUTS3 level

Population of Netherlands at NUTS2 and NUTS3 level

Hierarchical stocks: [circlepack](#)

Population of Netherlands at NUTS1-NUTS3 level

Population of Netherlands at NUTS1-NUTS3 level

Hierarchical stocks: `treemap`

- Treemaps plot nested lists as rectangles within rectangles.
- Treemaps requires a tiling algorithm.
- The treemap package uses the “squarify” algorithm, the industry standard (OEC, OWID, D3).
- “squarify” optimizes placement of tiles to approach a desired aspect ratio.
- Tiles are sorted by largest-to-smallest size, and iteratively placed by either “slicing” or “dicing” a starting rectangle, until all tiles are close to the desired aspect ratio.

Hierarchical stocks: **treemap**

Population of Netherlands at NUTS2 and NUTS3 level

Hierarchical stocks: **treemap**

Population of Netherlands at NUTS2 and NUTS3 level

Population of Netherlands at NUTS1-NUTS3 level

Hierarchical stocks: **treemap**

Population of Netherlands at NUTS2 and NUTS3 level

Population of Norway at NUTS2 and NUTS3 level

Hierarchical stocks: **treemap**

Population of Norway at NUTS2 and NUTS3 level

What can be improved

Some routines are very time and memory expensive:

- Exporting data back to Stata from Mata
- Plotting by colors
- Making shapes, for example, circles should be easier

Some optimization requests

- Allow point, line, area properties to be modified more easily
 - Allow angles, sizes, colors, clock positions, etc. to be read from variables (like mlabels)
 - Line weights (like marker weights)
 - Color scaling (starting and ending color)
- Allow adding custom markers (or increase marker pool)
- Allow colored text in graphs
- Ability to read images (pixel data)
- Ability to add images in figures
